

Problem-Solution Fit

Date	29 June 2026
Team ID	
Project Name	Personalized Networking Assistant
Maximum Marks	5 Marks

Problem-Solution Fit Canvas:

Use the framework below to ensure your proposed solution accurately addresses the root causes, behaviors, and limitations of your target audience.

1. Customer Segment (CS) Event attendees, university students, and business representatives.	6. Customer Limitations (CL) Basic smartphones, slow mobile connections, limited time to research.	5. Available Solutions (AS) • General search engine (Pro: broad; Con: slow, generic). • Memorizing lines (Pro: cheap; Con: awkward, inflexible).
2. Problems / Pains (PR) Anxiety when starting chats, failure to identify shared goals quickly.	9. Problem Root / Cause (RC) Lack of fast context-aware theme matching tools for dynamic topics.	7. Behavior + Intensity (BE) Stays quiet during coffee breaks (Intensity: High, misses networking chances).
3. Triggers to Act (TR) Entering a large conference hall, reading tech buzzwords.	10. Your Solution (SL) Personalized Networking Assistant: DistilBERT theme analysis + GPT-2 prompts + Wiki facts check.	8. Channels of Behavior (CH) Online: LinkedIn, event web sites. Offline: Event lounges, coffee queues.
4. Emotions (EM) Before: Overwhelmed, isolated, awkward. After: Self-assured, connected, empowered.		

Analysis of Fit and Audience Verification:

Our design ensures a direct alignment between user difficulties and system capabilities. By parsing the event description instantly, we save the user from spending time studying complex speaker schedules or keywords before the event. Furthermore, our offline-capable local AI model approach ensures that users can generate conversation prompts without relying on a strong Internet connection inside congested event halls, eliminating the typical network bottlenecks associated with online API calls.

The addition of the Wikipedia fact-checking mechanism bridges the gap in the user's domain knowledge. When faced with an unfamiliar technical topic, they can quickly query it to build background context, turning their social hesitation into active engagement. Lastly, the feedback collection mechanism ensures that the generative model's outputs can be graded and analyzed, providing a solid feedback loop to improve future prompt templates.
